 (vii) $n = 6, d = \frac{54}{5}$ (viii) $n = 7, a = -8$ (ix) $d = 6$
 (x) $a = 4$
4. 12. By putting $a = 9, d = 8, S = 636$ in the formula $S = \frac{n}{2}[2a + (n - 1)d]$, we get a quadratic equation $4n^2 + 5n - 636 = 0$. On solving, we get $n = -\frac{53}{4}, 12$. Out of these two roots only one root 12 is admissible.
5. $n = 16, d = \frac{8}{3}$ 6. $n = 38, S = 6973$ 7. Sum = 1661

17. 234 18. 143 cm
19. 16 rows, 5 logs are placed in the top row. By putting $S = 200, a = 20, d = -1$ in the formula
 $S = \frac{n}{2}[2a + (n - 1)d]$, we get, $41n - n^2 = 400$. On solving, $n = 16, 25$. Therefore, the
 number of rows is either 16 or 25. $a_{25} = a + 24d = -4$
 i.e., number of logs in 25th row is -4 which is not possible. Therefore $n = 25$ is not
 possible. For $n = 16, a_{16} = 5$. Therefore, there are 16 rows and 5 logs placed in the top
 row.

(ii) No. The eleven sums are not equally likely.

23. $\frac{3}{4}$; Possible outcomes are : HHH, TTT, HHT, HTH, HTT, THH, THT, TTH. Here, THH means tail in the first toss, head on the second toss and head on the third toss and so on.

24. (i) $\frac{25}{36}$ (ii) $\frac{11}{36}$

25. (i) Incorrect. We can classify the outcomes like this but they are not then 'equally likely'. Reason is that 'one of each' can result in two ways — from a head on first coin and tail on the second coin or from a tail on the first coin and head on the second coin. This makes it twice as likely as two heads (or two tails).

(ii) Correct. The two outcomes considered in the question are equally likely.
